Problem 1:

Find the turns ratio such that o/p V required is 100V at $\underline{0.5}$ for nominal i/p V = 12V

- a. Compute min & max value of D, if i/p varies from 10-14V. Keep V_0 constant
- b. Compute the value of L_s on sec. side so that i_2 is just continuous at the min. value of D.
- c. Find the value of 'C' for o/p voltage ripple of 1% at D = D_{max} Take $V_s = 0.8V$, $V_D = 0.8V$, $f_s = 2KHz$

Solution:

a. Volt.sec/turn
$$\left(d\phi = \frac{V.DT}{N}\right)$$

Balance is a must

$$\frac{1}{\mathbf{N}_{\scriptscriptstyle 1}} \big(\mathbf{V}_{\scriptscriptstyle DC} - \mathbf{V}_{\scriptscriptstyle S} \big) \mathbf{T}_{\scriptscriptstyle ON} = \frac{1}{\mathbf{N}_{\scriptscriptstyle 2}} \big(\mathbf{V}_{\scriptscriptstyle 0} + \mathbf{V}_{\scriptscriptstyle d} \big) \mathbf{T}_{\scriptscriptstyle off}$$

At nominal i/p V, $V_0 = 100V$ at D = 0.5

$$\therefore \frac{N_2}{N_1} = \frac{100 + 0.8}{12 - 0.8} = \underline{9}$$

Variation in D:

$$\frac{\mathbf{D}}{\left(1-\mathbf{D}\right)} = \frac{\mathbf{V}_0 + \mathbf{V}_d}{\mathbf{V}_{DC} - \mathbf{V}_s} \mathbf{X} \frac{\mathbf{N}_1}{\mathbf{N}_2}$$

If V_{DC} varies from the nominal value so will $\underline{\underline{D}}$

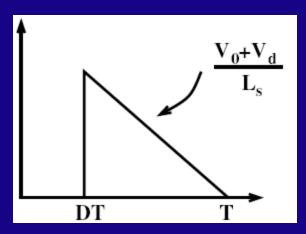

.. At
$$V_{DC} = 12V$$
 $D = 0.5$
= 10V $D = 0.55$
= 14V $D = 0.46$

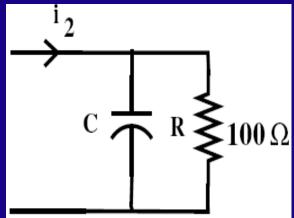

⇒ Controller should do this function

b. Value of L_s

$$\Rightarrow Av I_2 = Av I_0$$
neglecting ΔV_0 ,

$$\mathbf{I}_2 \left|_{\text{av}} = \frac{\mathbf{V}_0}{\mathbf{R}} \right|$$

$$\frac{1}{2}I_{p}\frac{\left(1-D\right)T}{T} = \frac{V_{0}}{R}$$

$$\therefore I_p = \frac{2V_0}{R(1-D)}$$

$$\Rightarrow I_{p} = \frac{V_{0} + V_{d}}{L_{s}} (1 - D) T$$

$$\therefore L_s = \frac{V_0 + V_d}{2V_0} (1 - D)^2 T R$$

 V_0 is held constant. V_0 should be just continuous

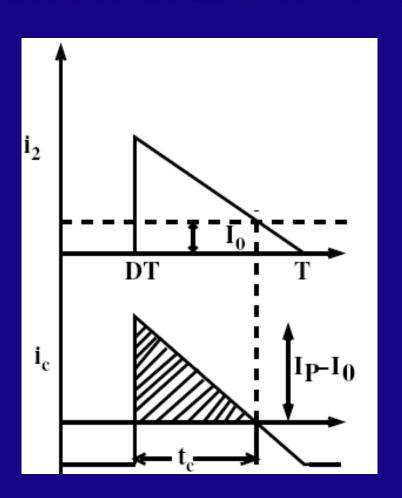

at
$$D = D_{min} = 0.46$$

$$\therefore L_s = 612 \mu H$$

- c. Duration for which $\text{'C' is charging } \big(\mathbf{i}_2 > \mathbf{I}_0 \big)$ Peak value of $\mathbf{i}_2 = \mathbf{I}_p$
- $i_2 \downarrow at$ the rate of $\frac{V_0 + V_d}{L_s}$
- \therefore Peak value of $i_c = l_p l_0$

$$\therefore \mathbf{t_c} = \frac{\mathbf{I_p} - \mathbf{I_0}}{\left(\frac{\mathbf{V_0} + \mathbf{V_d}}{\mathbf{I_s}}\right)}$$

$$\Delta \mathbf{q} = \mathbf{C} \Delta \mathbf{V}_0 = \frac{1}{2} \left\{ \mathbf{I}_{p} - \mathbf{I}_0 \right\} \mathbf{t}_{c}$$

$$\Rightarrow \Delta \mathbf{q} = \frac{1}{2} \left\{ \mathbf{I}_{p} - \mathbf{I}_{0} \right\} \frac{\mathbf{I}_{p} - \mathbf{I}_{0}}{\left(\mathbf{V}_{0} + \mathbf{V}_{d} \right)} . \mathbf{L}_{s}$$

we know,
$$I_0 = \frac{V_0}{R}$$
, $I_p = \frac{2V_0}{R(1-D)}$

$$\Rightarrow \Delta \mathbf{q} = \frac{1}{2} \left[\frac{2\mathbf{V}_0}{\mathbf{R}(1-\mathbf{D})} - \frac{\mathbf{V}_0}{\mathbf{R}} \right]^2 \frac{\mathbf{L}_s}{\mathbf{V}_0 + \mathbf{V}_d}$$

$$\Rightarrow \mathbf{C}\Delta\mathbf{V}_0 = \frac{1}{2} \left[\frac{\mathbf{V}_0}{\mathbf{R}} \right]^2 \frac{1}{\mathbf{V}_0 + \mathbf{V}_d} \mathbf{L}_s \left(\frac{1 + \mathbf{D}}{1 - \mathbf{D}} \right)^2$$

$$\therefore \frac{\Delta V_0}{V_0} = \frac{L_s V_0}{2R^2 C(V_0 + V_d)} x \left(\frac{1+D}{1-D}\right)^2 = 0.01$$

$$\Rightarrow$$
 C = 36μ **F**

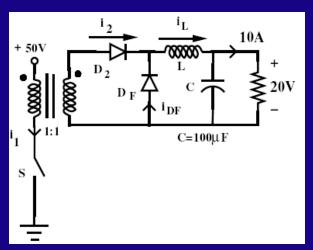

Problem 2:

A Forward converter is operating at the boundary of continuous / discontinuous conduction. Switching frequency is 100 kHz.

Assume $\mu \to \infty$ so that energy recovery winding is ignored

A load of 10A at 20V is being supplied

- a. Determine the value of 'L' &
- b. Determine peak to peak ripple in output voltage

Solution:

a.
$$V_0 = V_{DC} \left(\frac{N_2}{N_1} \right) D$$

$$\therefore D = 0.4$$

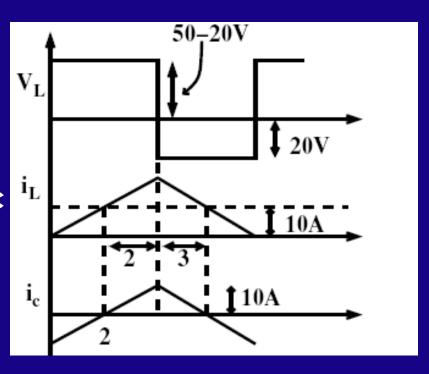

$$T_{on} = 4 \mu \text{ sec}$$
, $T_{off} = 6 \mu \text{ sec}$

av.
$$i_1 = I_0 = 10 A$$

$$\therefore I_p = 20 \text{ A}$$

$$\frac{\text{di}}{\text{dt}} = 5\,\text{A}/\mu\,\text{sec}$$

$$\therefore L = \frac{V}{\left(\frac{di}{dt}\right)} = \frac{30}{5} = 6 \,\mu H$$

b.
$$CdV_0 = dq = \frac{1}{2}x10x5 = 25\mu C$$

$$\therefore \Delta \textbf{V} = \frac{25\,\mu\,\textbf{C}}{100\,\mu\textbf{F}} = 0.25\,\textbf{V}$$

$$\therefore \frac{\Delta V}{V_0} = \frac{0.25}{20} = 1.25\%$$

- Flyback, Forward converter \rightarrow
- Operation in Ist quadrant only
- ⇒ Current through transformer is DC
- \Rightarrow Use 2 forward converters working in anti-phase
- \Rightarrow Bi directional core excitation
- ⇒ AC current through transformer
- ⇒ Both converters deliver power to the load in each half cycle
- \Rightarrow Both of them pushing power to the load
- ⇒ Push Push converter
- ⇒ Push Pull converter has prevailed
